Agenda.
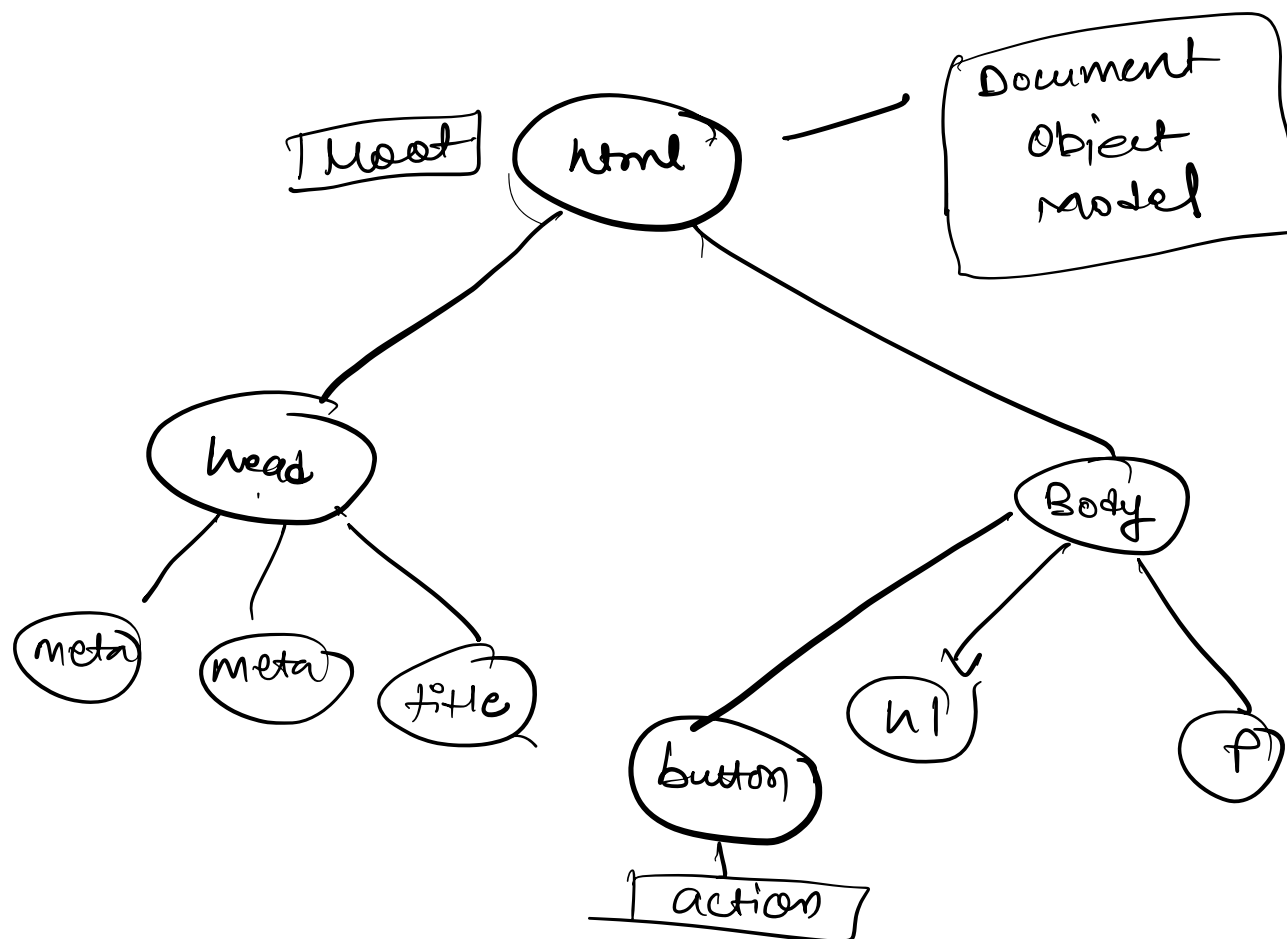

1) What is DOM?

2) Explore different Properties of DOM
   by solving Problems.

We will start sharp at 9:10 PM.

Query Selector ✓

getElementBy ID ✓

```
[ Say hello ] ----→ [ An Event ] ----→ [ Event Listeners ]

[ hello ]
```
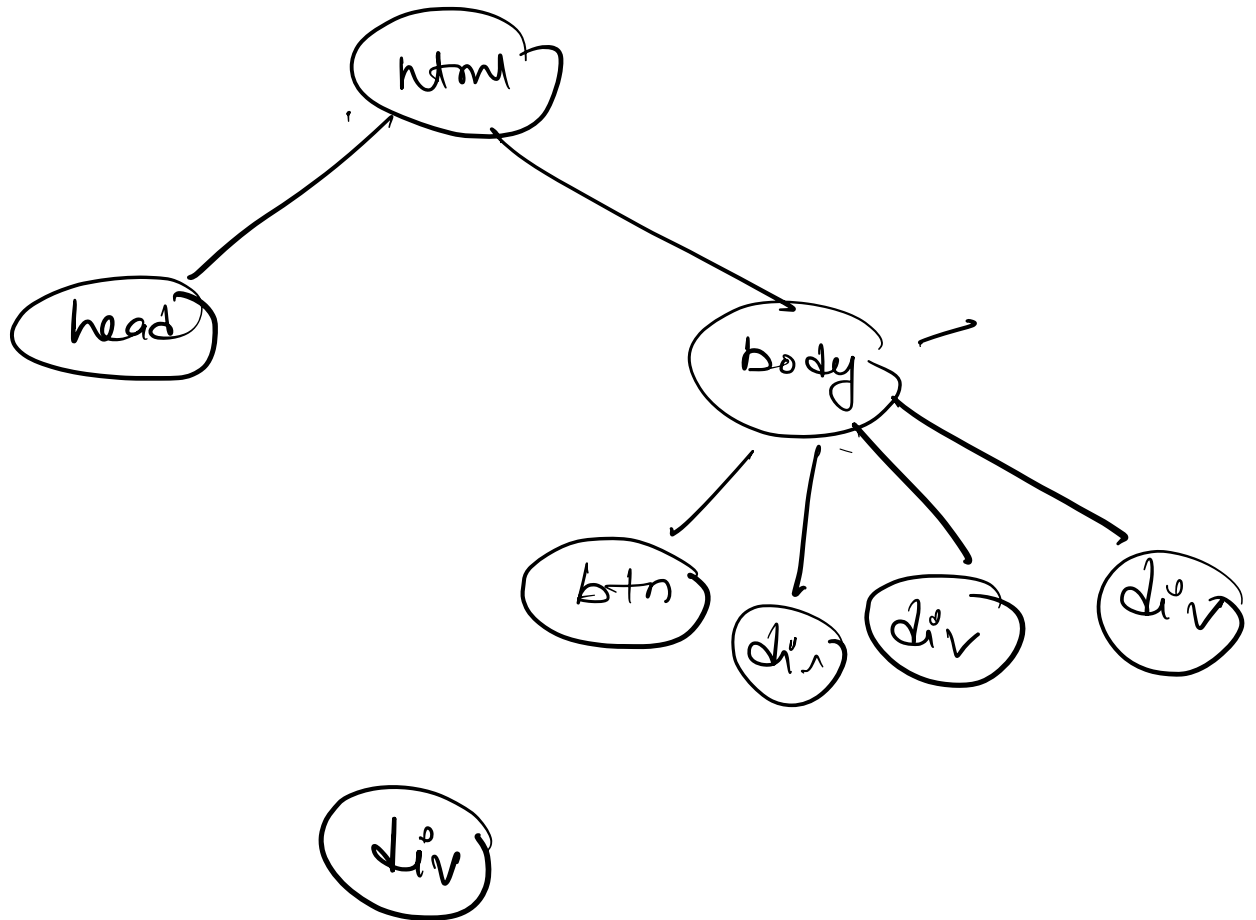

Query Selector = This is a document method which is used to select an Element based on a class or an ID, you have to specify what you want to select.

getElementBy ID – This is a document method which is used to select an Element with the help of ID

Event Listeners → Event Listeners are those method which can Register an Event for an Element so it can perform some tasks based on those Events

we have add Event Listener method to Register an
Event for an Element.

```
html
  ├── head
  └── body
        ├── btn
        ├── div
        ├── div
        └── div

div

<div> hello </div>
```

| Node list | → | Array like structure which wi

get all the Elements of Same type
inside a list and they will be Indexed.

[li, li, li, li ...]
you can use loop with Node list
